Open Elective End Sem project of sem 4

Report 1: Problem Statement & Scope

Team Members:
Bageshri Welekar (Role A) - Roll No: 03
Aryan Salve (Role B) - Roll No: 28

Institution: Ramdeobaba University
Date: April 25, 2026

1. Executive Summary

The digital era has ushered in a period of 'Information Overload,' where the volume of niche news makes it nearly impossible for individuals to stay updated without significant manual effort. This project introduces the Newsletter Curator, a sophisticated system designed to automate the lifecycle of content gathering, thematic organization, and editorial presentation. By leveraging a multi-agent AI architecture, we transform raw web data into a refined, high-engagement newsletter, ensuring both accuracy and relevance through automated validation.

2. Detailed Problem Statement

In a world where speed and precision are paramount, traditional methods of news curation face several critical bottlenecks:

- Manual Inefficiency: Searching for trending stories across various platforms is time-consuming and often yields fragmented results.
- Lack of Categorization: Aggregated data is often disorganized, making it difficult for readers to find specific sub-topics of interest.
- The Credibility Gap: AI-generated summaries can suffer from hallucinations; without a rigorous evaluation mechanism, the reliability of the content remains in question.
- Engagement Barriers: Creating catchy subject lines and summaries that provide value while being concise requires creative effort that is hard to scale manually.

3. Proposed Solution & Objectives

Our system addresses these issues by deploying a team of specialized agents, each focused on a singular task within the pipeline. This project demonstrates the practical application of Natural Language Processing (NLP) and Multi-Agent Systems to solve real-world content automation challenges efficiently.
