Open Elective End Sem project of sem 4

Report 2: Task Decomposition & Implementation

Team Members:
Bageshri Welekar (Role A) - Roll No: 03
Aryan Salve (Role B) - Roll No: 28

Institution: Ramdeobaba University
Date: April 25, 2026

1. Role-Based Task Decomposition

Role A: Bageshri Welekar (Architect & Integrator)

As the Architect, Bageshri Welekar was responsible for the high-level logic and the structural integrity of the system:

- System Architecture Design: Defined the overall system architecture and workflow between agents (Researcher, Grouper, Writer, Judge).
- Workflow Engineering: Managed the integration of APIs and tools to ensure smooth data flow.
- Integration Orchestration: Structured project files and modules for professional-grade deployment.
- Standardization: Ensured all components adhered to the defined design document for consistency.

Role B: Aryan Salve (Builder & Deployer)

As the Builder, Aryan Salve focused on turning the architectural vision into a working application:

- Core Logic Implementation: Implemented core application logic in the main system file (app.py).
- Agent Development: Developed the specific agent modules for research, grouping, writing, and judging.
- Environment Management: Handled environment setup, dependencies, and testing of system functionality.
- Deployment: Managed deployment configuration including Procfile and railway.toml.

2. System Modules Overview

Agent Name	Primary Responsibility
Researcher	Collects trending news data and researches niche stories.
Grouper	Organizes news into meaningful categories.
Writer	Generates structured newsletter content and subject lines.
Judge	Evaluates quality, readability, and factual accuracy.

3. Conclusion

The project successfully highlights the practical implementation of AI agents in content automation at Ramdeobaba University. Tasks were efficiently divided between Bageshri Welekar and Aryan Salve, ensuring a seamless transition from design to deployment.
